

There are seven continents on our planet: [Asia](#), [Africa](#), [North America](#), [South America](#), [Antarctica](#), [Europe](#), and [Australia](#). These landmasses form the world's geographical structure, each possessing features particular to themselves, biodiversity, culture, and economic significance. A continent is generally defined as a large, continuous, discrete mass of land separated from others by expanses of water. However, defining a continent is not always straightforward due to varying perspectives influenced by cultural and geographical factors. <https://www.worldatlas.com>

There are usually seven recognized continents, but there are alternative models. As represented by the five Olympic rings, the five-continent model includes Europe, Asia, Africa, America (combining North and South), and Oceania (including Australia). This model is based on the view of continents as inhabited landmasses, leaving out Antarctica.
